Lecture 07

QUEUE

INTRODUCTION

- A queue is a linear list of elements in which deletion can take place only at one end, called the front, and insertions can take place only at the other end, called the rear.
- The term "front" and "rear" are used in describing a linear list only when it is implemented as a queue.

Implement a queue

- There are main two ways to implement a queue:
- 1. Circular queue using array
- 2. Linked Structures (Pointers)
- When a queue is implemented using array, that queue can organize only limited number of elements.
- When a queue is implemented using linked list, that queue can organize unlimited number of elements

Operations

Primary queue operations:

- Enqueue: insert an element at the rear of the queue
- Dequeue: remove an element from the front of the dnene

Insertion in Queue

```
This algorithm inserts an element ITEM into a circular queue.
Algorithm: ENQUEUE(QUEUE, MAXSIZE, FRONT, REAR, COUNT, ITEM)
```

 [QUEUE already filled?]
 If COUNT = MAXSIZE then: [COUNT is number of values in the QUEUE] Write: OVERFLOW, and Return.

If COUNT = 0, then: [Queue initially empty.] Set FRONT = 0 and REAR = 0 Find new value of REAR.

Else: if REAR = MAXSIZE - 1, then:

Set REAR = 0

Set REAR = REAR+1.

[End of If Structure.]

Set QUEUE[REAR] = ITEM. [This insert new element.]
COUNT = COUNT + 1 [Increment to Counter.]

Retum.

Deletion in Queue

DEQUEUE(QUEUE, MAXSIZE, FRONT, REAR, COUNT, ITEM) Algorithm:

This procedure deletes an element from a queue and assigns it to the variable ITEM.

1. [QUEUE already empty?]

If COUNT = 0, then: Write: UNDERFLOW, and Return.

Set ITEM = QUEUE[FRONT].

. Set COUNT = COUNT -1

[Find new value of FRONT.]

If COUNT = 0, then: [There was one element and has been deleted]

Set FRONT = -1, and REAR = -1.

Else if FRONT = MAXSIZE, then: [Circular, so set Front = 0]

Set FRONT = 0

ESC.

Set FRONT:=FRONT+1.

[End of If structure.]

5. Return ITEM

Queue Example

- Following Figure shows that how a queue may be maintained by a circular array with MAXSIZE = 6 (Six memory locations).
- Observe that queue always occupies consecutive locations except when it occupies locations at the beginning and at the end of the array.
- If the queue is viewed as a circular array, this means that it still occupies consecutive locations. Also, as indicated by Fig(k), the queue will be empty only when Count = 0 or (Front = Rear but not null) and an element is deleted.
- For this reason, -1 (null) is assigned to Front and Rear.

MaxSize = 6

(a) Initially QUEUE is Empty

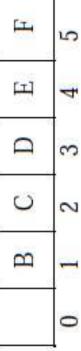

Front =
$$-1$$
Rear = -1
Count = 0

Implement Circular QUEUE using array

```
bool IsFull() { if( count== MAXSIZE) return true; else return false;}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Zero
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     if(count == 0) rear = front= 0; // first item to enqueue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            50
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         // Circular, rear set
                                                                                                                                                                                                                                                                                                                                bool IsEmpty() { if (count == 0) return true; else return false;

                                                                                                                                                                                                                                                                                                                     case
                                                                           while (1)
int main()
```

- node is always pointed by 'rear' and the first node is In linked list implementation of a queue, the last inserted always pointed by 'front'.
- To implement queue using linked list, we need to set the following things before implementing actual operations.

Step 1: Include all the header files which are used in the program. And declare all the user defined functions.

Step 2: Define a 'Node' structure with two members data and next.

Step 3: Define two Node pointers 'front' and 'rear' and set both to NULL.

Step 4: Implement the main method by displaying Menu of list of operations and make suitable function calls in the main method to perform user selected operation.

enQueue(value) - Inserting an element into the Queue:

Step 1: Create a newNode with given value and set 'newNode → next' to NULL.

Step 2: Check whether queue is Empty (rear == NULL)

Step 3: If it is Empty then, set front = newNode and rear = newNode.

Step 4: If it is Not Empty then, set rear - next = newNode and rear = newNode.

deQueue() - Deleting an Element from Queue:

```
Step 1: Check whether queue is Empty (front == NULL).
```

Step 2: If it is Empty, then display "Queue is Empty!!! Deletion is not possible!!!" and terminate from the function

Step 3: If it is Not Empty then, define a Node pointer 'temp' and set it to 'front'.

Step 4: Then set 'front = front → next' and delete 'temp' (free(temp)).

display() - Displaying the elements of Queue:

```
Step 1: Check whether queue is Empty (front == NULL).
```

Step 2: If it is Empty then, display 'Queue is Empty!!!' and terminate the function.

Step 3: If it is Not Empty then, define a Node pointer 'temp' and initialize with front.

Step 4: Display 'temp → data --->' and move it to the next node. Repeat the same until 'temp'

reaches to 'rear' (temp \rightarrow next != NULL).

Step 4: Finally! Display 'temp → data ---> NULL'.

Program for Queue Using Linked List

```
default: printf("\nWrong selection!!! Please try again!!!\n");
                                                                                                                                                                                                                                                                                                                                                                                                                                      printf("\n:: Queue Implementation using Linked List ::\n");
